

ABSTRACT OF THE DISCLOSURE

5 A portable enclosure, easily erectable and collapsible,
to provide environment control and prevent contaminants from
being released from the enclosure. The enclosure provides a
flexible envelope attached to the interior of the space
defined by vertical and horizontal supports which can be
erected and collapsed. When erected the enclosure functions
10 as an anteroom and has removable panels in the sides and top.
In use, the enclosure is sealed against a vertical or
horizontal surface to be worked on and a panel from the side
of the enclosure is opened and closed to provide access to the
surface by the user. When collapsed the enclosure is a
15 package approximately the size of an average golf club bag
which is easily portable to another location. Ducting is
provided to which negative pressure pumps are connected to
maintain negative pressure within the enclosure and draw
contaminants into the pump and then into a closed container.
20 In one embodiment, a four-sided flange extends from the rear
side of the enclosure to allow sealing of the flange around
the doorway and thereby provide a mechanism for isolating the
room located interiorly of the doorway.
